Good Morning Everybody

Integrated care for older people (COPE) is a guidance for person-centred assessment and pathways in primary care. Initially developed by WHO to be used by care or social workers all around the world.

This app is available on a smartphone or computer easily, allowing each GP, whatever their situation in EUROPE and in the world, urban or rural, isolated or in a primary care team.

A guideline development group convened by WHO formed these recommendations by consensus, supported by input from a wide range of stakeholders. ICOPE is organized around the 6 priority actions:

1-Malnutrition ,
2-mobility loss,
3-hearing loss ,
4-visual impairment,
5-cognitive impairment,
6-depressive symptoms,

If need, to go further,
-A global evaluation it lead to:
-A personalised care plan, with
follow up

The ultimate goal is to avoid dependancy and preserve patient autonomy..

If you haven't already loaded the app on your smartphone you can do it right now on play store or Apple Store.

<https://play.google.com/store/apps/details?id=com.universaltools.icope&gl=US>
<https://apps.apple.com/us/app/who-icope-handbook-app/id1482388332>

Richard, 79, retired from the automotive industry, has been in an Elderly Home for 1 year, he decided to enter it after a knee replacement , because he has not recovered his mobility.

- He complains to the staff: With his knee, he walks slowly, and to get up from the chair he has to lean on the table.

He finds that it is not funny to grow old like that.

-No Hearing problems, he wear glasses, no cognitive problems, no cardiovascular risks. BMI 25, waist circumference 89, blood test normals, arterial pressure 125/80.

-The nurse ask you to help Richard and you decide to perform an evaluation with ICOPE

What is the result ?

Peter a former diplomat lives alone in a comfortable residence in a large park on the heights of the city a governess comes every morning to clean and take care of him.

Despite his 83 years he keeps good mobility and takes long walks every afternoons.

However, the governess noted that for some time he has lost weight he neglects his outfit a little, he who was very elegant and smart. Lately he no longer remembered that he had to pay the housekeeper's wages and he has anger against her.

This worried the housekeeper, and she made an appointment to take stock of Peter's state of health in particular his cognitive function.

In peter's medical file, you did not notice anything in particular. 1,85 meters tall for 80 kilos normal blood pressure no cardiovascular risk and his cognitive state did not seem to you to be altered during his last appointment 1 year ago years

What is the result ?

Your comments:

- How did you feel with this app?
- What would be the subject matter improvements you could make?
- Do you think you could delegate this kind of evaluation to a nurse or other healthcare staff in your own practice?

Thank you to attend and we wish you a pleasant stay in Paris

We will be very grateful if you could send your feedback on :
